

PostSkill Task:-

1.What is Ghost Phisher?

Ghost Phisher is a tool used for performing social engineering attacks and network penetration testing, including creating fake access points and capturing credentials from unsuspecting users through phishing and man-in-the-middle attacks.

2.Name the dependencies that are required in the proper running of Ghost Phisher.

Dependencies include `airmon-ng` and `aircrack-ng` for wireless networking, `dnsmasq` for DHCP and DNS services, `hostapd` for creating fake access points, and `python` and `python-tk` for the graphical interface.
